

INSECTS

six-banded longhorn beetle (*Dryobius sexnotatus*)

DISTRIBUTION & ABUNDANCE: State listed as special concern. The distribution and status of this species in the State is currently undetermined. It is known historically from only one location and it may be extirpated from the State. Its status globally is also undetermined.

ASSOCIATED LANDSCAPE FEATURES: lowland hardwood; mesic conifer; river/stream/riparian/floodplain corridor; snag/cavity; late successional forest

ASSOCIATED THREATS: disease, pathogens, & parasites; incompatible natural resource mgmt; forestry practices; pesticides & herbicides

COMMENTS: Need surveys to determine presence in the State and, if present, assess abundance and distribution. Its requirement for very old sugar maple trees results in this species' association with late successional forests. Spraying for gypsy moths may pose a significant threat to this species.
